

Hope this will be useful:

What you will need:

- Proxifier
- Tor(or tor browser)
- Vip72 Client
- Vip72 Subscription

Ok let's get started:

1. Set new profile

Let's open proxifier and make a new profile "File"->"New Profile" or press Ctrl+N

2. Add proxy servers

Now go to "Profile"->"Proxy Servers" and press "Add..." and type in address "127.0.0.1" and Port "9050" if you use Tor stand alone, if you use Tor Browser Port "9150". You can change port of Tor in torcc config.

Protocol is "Socks Version 5" and press OK. A pop-up will appear asking if want to use this proxy by default, click "Yes".

Now add another with address "127.0.0.1" and Port "9951" "socks version 5" and press OK. this is vip72 socks5. Now close proxy servers window.

3. Add tor proxy rule

Go to "Profile"->"Proxification Rules..."

Press "Add..." and name it "Tor" now right under applications press "Browse..." and look for Tor.exe(its in \data\ in Tor Browser) select it and it should be added to applications list. If you use Tor Browser also add Videlia.exe (\data\), Plugin-Container.exe(\firefoxportable\app\firefox\) and tbb-firefox.exe or firefox.exe in tor browser 3 alpha(\firefoxportable\app\firefox\) now set Action: to "Direct" and press OK.

4. Add vip72 proxy rule

Now in proxification rules press "Add..." again and this time we are going to name this "vip72client", Browse... and select "vip72socks.exe" and set Action: to "127.0.0.1:9050"(tor) or "127.0.0.1:9150"(tor browser) and press OK.

5. tunnel all or specific program through vip72

Final step, uncheck "Localhost" in proxification rules and for "Default" set Action: to "127.0.0.1:9951" this will route all programs(except tor browser) through vip72.

If you only want one specific program(for ex. firefox portable) to use vip72 leave Default action: to Direct or set Blocked, add new Rule with "Add..." and browse all the program .exe's(also plugin exe etc) and set their action to "127.0.0.1:9951"

6. Let's fire it up!

Open Tor/Tor Browser -> Login to vip72 -> Connect to a vip72 socks proxy -> Open up firefox --> done

I recommend using a modified/stealth firefox portable with this.

be aware the proxifier won't support udp connections. So you if try proxying skype or a voip client it

will still go through directly no matter what.
