

(A VPN running on IPv4 doesn't have any potential breaches).

If your VPN is running on IPv6 follow these steps because there is recent potential security breach in IPv6 that could leak your real IP address if an attacker knows how to try to get it.

- 1) Go to Start-> Network -> properties
- 2) Right click your network card and click properties
- 3) In Local Area Network Properties, uncheck Internet Protocol Version 6 (TCP/IPv6)
- 4) Open up the command prompt (Start -> run -> cmd)
- 5) Type regedit
- 6) Registry editor will appear, locate following registry item:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip6\Parameters\DisabledComponents

If the DisabledComponents item isn't there, you must make it by...

- A) Click Edit -> new -> DWORD (32-bit) value
 - B) Type DisabledComponents and press enter
- 7) Double-click DisabledComponents, set the value as 0xffffffff (hexadecimal value)
 - 8) Restart computer
